

CSM & SUPPORT TICKET WORKFLOW

Standard Operating Procedure & Ticket Lifecycle Flowchart

Format: Reference Document
System: NeoComp CSM

1. TICKET LIFECYCLE FLOWCHART

2. KEY CSM FUNCTIONAL MODULES

TICKETS MANAGEMENT

- Central repository for all support requests with automated, incremental Ticket IDs.
- Rich comment threads to facilitate collaboration between customers, dispatchers, and engineers.
- SLA countdown timers showing remaining response and resolution times visually.

SERVICE VISITS

- Dispatch engineers to customer premises directly from ticket details.
- Geo-tagged Check-In and Check-Out (capturing GPS coordinates and timestamps).
- Service visit reports filled by engineers detailing work done, parts replaced, and customer signature.

ENTITLEMENTS (WARRANTY & AMC)

- Track AMC Contracts, warranty periods, start/expiry dates, and contract documents.
- Auto-link tickets to valid warranties or active AMC contracts for the selected Product Serial Number.
- Flags out-of-coverage assets to ensure appropriate billing prior to dispatch.

CSM MASTER CONFIGURATION

- Priorities Master: Define SLA hours for response & resolution and color codes for each tier.
- Categories & Ticket Types: Classify tickets (e.g., Installation, Repair, Inquiry) to structure routing.
- Sources & Designations: Track ticket source channels (e.g., Portal, Email) and contact designations.

3. PRIORITY CONFIGURATION & SLAS

Tickets created in NeoComp CSM are bound by Service Level Agreement (SLA) policies configured in the Masters. When a ticket is raised, the system parses the selected Priority (e.g., High, Medium, Low) and applies its Response and Resolution SLA timers.

If a ticket status is changed to "Pending Customer", the SLA timer is paused to prevent unfair breaches due to customer delays. The timer resumes once the customer responds or when the ticket is set back to "In Progress".
